```
This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only memory (RAM), read-only searches using that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been identified and these polypeptides can also be used in a kit for the immunodetection of solypeptides can also be used in a kit for the immunodetection of scanned in a kit for the immunodetection of shock skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can the used community of any of the S. aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  211 tggattgtcaccttatggttacaaatcctcttgattatgttgaacccttggcaaaagctg 270\,

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcus infection in an animal and monitoring progression of disease, and for identifying agents which can be used to another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7132 ATCAATGCITITGCGGAAGCCGGTGCGGATATTATTACCGTCCATCAAGAAGCAACACCC 7073

polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus Computer-readable medium with recorded Streptococcus pneumoniae pneumoniae

Claim 1; Page 998-1006; 1409pp; English.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded on it, or a representative fragment or a sequence at least 95% identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO:1 premmoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members; or (b) isolating mRNA, DNA or CDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical vaccines for S. pneumoniae.

The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrelia infections in animals, and for the production of blosynthetic products such as enzymes.

```
The present sequence encodes a Rice D-ribulose-5-phosphate-3-eplmerase (RPE) nematode response protein. The enzyme is activated during the initial steages of nematode infestation of roots and is required for formation of the giant feeder cells on which the nematodes depend. Interfering with expression of the protein will thus inhibit nematode infestation. The RPE polynucleotide is used to produce transgenic plants (specifically potato, tomato, beet, rape and rice) that are resistant (or at least less susceptible) to nematode infestation. This is achieved by either expressing antisense sequences
                                                                                                                                                                                                                                                                                                                                         15093 TGCGTAGCAAAACGCACCTGCCGTTTGATGTTCACCTGATGGTCAGTAGGCCTGCCGACC 15034

3-epimerase (RPE) nematode response profein. The enzyme is activated during the initial stages of nematode infestation of roots and is required for formation of the giant feeder cells on which the nematodes depend. Interfering with expression of the protein will thus inhibit nematode infestation. The RPE polynucleotide is used to produce transgenic plants (specifically potato, tomato, beet, rape and rice) that are resistant (or at least less susceptible) to nematode infestation. This is achieved by either expressing antisense sequences in the plant; or by using the promoter of the RPE gene to express an anti-nematode protein. Inhibition of the RPE protein or gene enables plant to mount an immediate response to the invasion of the nematode, consequently limiting the level of cellular damage and reducing the complications of secondary infections.
                                                                            Nucleic acid encoding D-ribulose-5-phosphate-3-epimerase is used to increase resistance to root nematodes
                                                                                                                                                                                                         present sequence encodes an Arabidopsis D-ribulose-5-phosphate
                                                                                                                                                     Claim 1; Page 44-45; 62pp; French.

```
This sequence encodes a Streptococcus pneumoniae protein of unknown function, and represents a DNA sequence of the invention.

The DNA sequences were isolated from Streptococcus pneumoniae strain 0100993 (NCIMB 40794). The Streptococcus pneumoniae proteins of the invention can be used to identify compounds which interact with and inhibit or activate the activity of the proteins. Antagonists can be used to treat diseases caused by 5. pneumoniae proteins, through genetic immunisation. They can also be used to induce an immunological response in a mammal by inoculation with the 5. pneumoniae proteins or delivery of the encoding nucleic acids in a vector adequate to produce antibody and/or T cell immune responses to protect the animal from disease. The proteins can also be used to identify antimicrobial compounds which are capable of inhibiting their bloactivity. In particular the proteins of the invention can be used to prevent adhesion of bacteria to mammalian extracellular matrix proteins on in-dwelling devices or in wounds, to block protein-mediated mammalian cell invasion, and to block the normal progression of pathogenesis in infections initiated other than by the implantation of in-dwelling devices or other surgical techniques.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           956 aagattgctccgtcaattctggcagcagattatgccaactttgaacgtgaaatcaaacgt 1015

This invention describes novel isolated Streptococcus pneumoniae polynucleotides (see 29617-29694) and their encoded proteins (see 786792-886182). The DNA, vectors and host cells described in the method of the invention are useful for the recombinant expression of the polypeptides. The polypeptides are useful for treatment or prevention of disease, or diagnosis of disease related to expression or activity of such a polypeptide. They can also be used to screen for compounds which interact with and inhibit or activate such a polypeptide. The compounds which colypeptides (or DNA encoding them, via gene therapy) are also useful for inducing an immunological response in a mammal. The antagonists are useful to inhibit such bacterial polypeptides. The polypeptides are particularly useful to identify antimicrobial compounds and antibiotics. They are also useful to determine their role in pathogenesis of infection, dysfunction and disease.
                                                                                                                        Treatment; prevention; disease; diagnosis; gene therapy; screening; bacterial; antimicrobial; antibiotic; pathogenesis; infection; ss.

The present sequence represents an essential Staphylococcus aureus gene. The invention relates to a method for screening for an antibacterial sepent. The method comprises determining if a test compound is active against the essential bacterial genes (A26850-A26956). The invention also includes a method for evaluating an agent for activity on the essential genes. Also included in the invention is the production of an antibacterial agent. The antibacterial agents of the invention are used to treat or prevent bacterial infections, particularly where caused by Staphylococcus aureus. The antibacterial agents are unlikely to be

This sequence encodes a Streptococcus pneumoniae protein of unknown the direction. The invention provides DNA sequences (V65201 to V63304) from the Streptococcus pneumoniae genome and corresponding protein sequences (W80605 to W80728). A recombinant host containing a vector comprising any of the above nucleic acids can be used for the recombinant expression of the protein sequences. The invention also provides a DNA chip having arrayed on it at least 15 base pair fragment of any one or more of these bNA sequences. The DNA chip having methods for evaluating gene expression in S. pneumoniae and for identifying virulence genes in S. pneumoniae and the selectively bind to the above proteins or peptide fragments can be used to treat S. pneumoniae infection. The

Sequences A31040-A32093 represent novel plant microsatellite sequences and associated flanking species. The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and ilbrary screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.
                                                                                                                                                                                                                                                                                                                                                                                                      Plant microsatellite sequence; core repeat sequence; detection; probe; DNA polymorphism; genome mapping; physical mapping; fingerprinting; variety identification; genetic variability evaluation; primer; ss.

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded to it, or a representative fragment or a sequence at least 938 identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the S.pneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 391, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members or (b) isolating mRNA, DNA or CDNA produced molecules from the members or (b) isolating mRNA, DNA or CDNA produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5. pneumoniae genome of commercial importance, or expression modulating
fragments of the S. pneumoniae genome. Products from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            used in diagnosis kits and assays, and pharmaceutical
from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the fragment of the S. pneumoniae genome to prime the amplification and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vero cells were cultured in the presence of actinomycin D and infected with PIV-2. Poly(A)+ RNA was isolated from the infected cells and a cDNA library was prepared. The library was screened with a nucleocapsid RNA probe. A positive clone containing the PIV-2 ene was sequenced. The gene can be used for early diagnosis of PIV-2 infection and as a raw material for vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The sequences comprise a central core repeat sequence, especially selected from the sequences A32094-A32096 with left and right flanking sequences. The polynucleotide sequences can be used in the detection of DNA polymorphisms, in genome mapping, in positional cloning of genes, in variety identification and in evaluation of genetic variability within and between plant tissues, populations, cultivars, species and species groups. They may also be used to design hybridization probes for oligonucleotide fingerprinting and ilbrary screening and to design primers for microsatellite-primed PCR. Microsatellite markers are useful to locate specific economically useful genes in plant genomes.
                                                                                                                                                                                                                                                                                           Plant microsatellite sequence; core repeat sequence; detection; probe; DNA polymorphism; genome mapping; physical mapping; fingerprinting; variety identification; genetic variability evaluation; primer; ss.

The Bb polypeptides can be used in vaccines for eliciting protective antibodies to members of the Borrelia genus, particularly for the use against Lyme disease in humans and animals. They can be used for preventing or attenuating an infection caused by a member of the Borrelia genus. The products can also be used for detection of members of the Borrelia genus.

SOURCE

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUMMARIES

ALIGNMENTS

Strategiers of IIISC Strate Synthesis Partner, and Strategiers of IIISC Strates Synthesis, the CDNA ends were 'polished' with Cone Pt' DNA polymerase.' ligated to EcoRI adapters, with cone Pt' DNA polymerase.' ligated to EcoRI adapters, and phosphorylated. The XDIS site within the first-strand synthesis primer was restricted by digestion with XDOI; all XNOI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500bp cutoff, using GibcoBRL Life Technologies' CDNA Size Practionation column. The column eluent was then ligated into Stratagene's pBluescript II XR Predigested vector (pBluescript II SK(+) that had been digested with EcoRI and XDOI, and phosphorylated). Both the white and blue colonies appear to contain recombinant plasmids with cDNA inserts. Blue colonies 9m-15) have been sequenced, and possess putative cDNA inserts. This library was constructed by Dr. Paul Kelm & Viiginia H. Coryell, paul Keim), 520-523-1078 (Dr. Paul Keim), 520-523-1078 (Dr. Paul Keim), 520-523-1078 (Dr. Paul Keim), 60-523-1070 (miversity, Fax: /note="Vector: pBluescript II XR; Site_I: EcoRI; Site_2: XhoI: Root cDNA. The mRNA was isolated from entire roots of 8 day old 'Williams' seedlings which were propagated on paper towels with distilled water. Stratagene's cDNA Synthesis Kit (catalog #200401) was used to synthesize the CDNA. First strand Synthesis was performed with 5-methyl dCTP, hence the ligated cDNA is hemimethylated. Stratagene's first-strand synthesis primer was used Shoemaker, R. Keim, P., Vodkin, L., Erpelding, J., Coryell, V., Khanna, A., Bolla, B., Marra, M., Hillier, L., Kucaba, T., Martin, J., Beck, C., Wylie, T., Underwood, K., Steptoe, M., Thelsing, B., Allen, M., Bowers, Y., Person, B., Swaller, T., Gibbons, M., Pape, D., Harvey, N., Schurk, R., Kitter, E., Kohn, S., Shin, T., Jackson, Y., Cardenas, M., McCann, R., Waterston, R. and Wilson, R. XhoI; Root cDNA. The mRNA was isolated from entire roots
Apol "Williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's cDNA
Synthesis Kit (catalog #200401) was used to synthesize the
CDNA. First- strand synthesis was performed with 5-methyl
dCTP, hence the ligated cDNA is hemlmethylated.
Stratagene's first-strand synthesis primer was used
[GAGGAGAGAGAGAACTACTCGAG(T).18]. After
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      aatttggetteegaageeteagegeatgeteeaetteggegeegattggeteeacatggae 128

XhoI; Library Gm-r1021 is a sequence-driven, reracked set
of the original library Gm-c1004 which was prepared from
root CDNA. The mRNA was isolated from entire roots of 8
day old 'Williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's cDNA
Synthesis Kit (catalog #20040I) was used to synthesize
the cDNA. The Gm-c1004 library was constructed by Dr.
Paul Keim & Virginia H. Coryell, Department of Biology,
Box5640, Northern Arizona University, Flagstaff, Az 86011
'email: paul keim@eau.edu, virginia.coryell@nau.edu. The
contig analysis to select unique genes was performed by
the laboratory of Ernest Retzel, Computational Biology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota, Viridiplantae, Embryophyta, Tracheophyta, Spermatophyta,
Magnoliophyta, eudicotyledons, core eudicots, Rosidae, eurosids I,
Fabales, Fabaceae, Papilionoideae, Glycine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vodkin, L., Keim, P., Shoemaker, R., Retzel, E., Khanna, A., Coryell, V., Erpelding, J., Raph, C., Shoop, E., Pardinas, J., Liu, L. and Lewin, H.
